

MathType⁶ for Windows

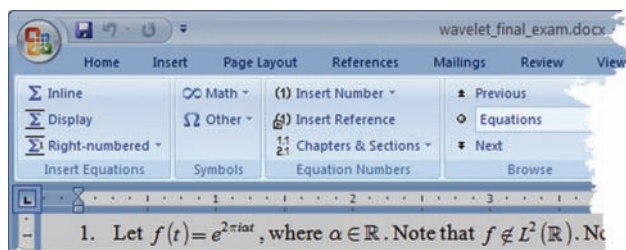

The *best* thing for writing equations since chalk!

MathType with Microsoft Office

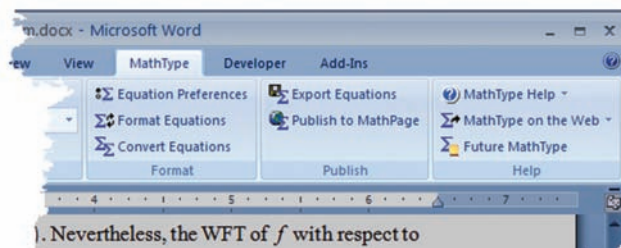

MathType Ribbon Tab in Word and PowerPoint 2007

MathType™ takes full advantage of Office 2007's new Ribbon User Interface making it easier than ever to do equation operations in documents and presentations. New equation numbering and browse features work with all Word equation types. It also gives quick access to commands to move forward and back one equation at a time, insert equation numbers, references, or to convert a Word document to a web page.

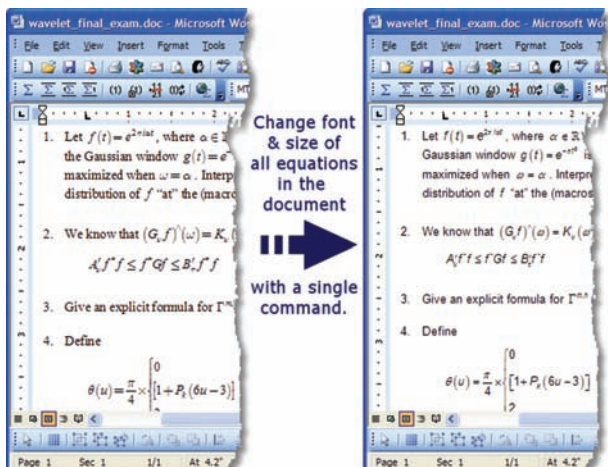

MathType Toolbar and Menu in Word and PowerPoint 2003, XP, and 2000

MathType adds a toolbar and menu to Microsoft Word and PowerPoint, allowing quick access to its features and powerful commands to do equation numbering, produce great-looking math web pages, presentations, and much more.

Change fonts for all equations in a Word document

MathType allows you to change fonts and/or font sizes for all equations in a document, or a selected part of a document, in a single operation.

Create math-savvy accessible web pages

MathType includes our exclusive MathPage™ technology that easily converts Microsoft Word documents into web pages, properly handling mathematical symbols as well as MathType and Equation Editor equations.

Color all or part of an equation

Great for slide presentations and teaching. Use color to highlight part of an equation to focus your students' attention on it. Show the part that changed in each step of a multi-step procedure.

More symbols, templates, and fonts

MathType has hundreds more symbols and templates than Equation Editor. Beside our exclusive Euclid™ math fonts, you can also make use of the 1000's of math symbols in fonts already on your computer, as well as math fonts you can download from the Internet.

MathType Saves Time

Save expressions in the toolbar

Drag hundreds of your most frequently used symbols, expressions, and equations to the MathType toolbar so they can be inserted later with just a click or a keystroke.

Named tabs

Organize your toolbar using named tabs (e.g. Geometry, Algebra, etc.). Customize the names as you see fit.

Keyboard shortcuts

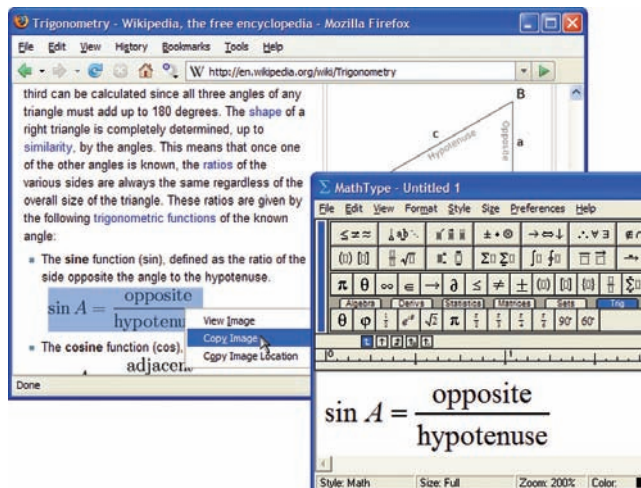

Associate a keyboard shortcut with any symbol, template, or expression so that it can be inserted later using just the keyboard.

Works with Many Applications

In addition to Microsoft Word and PowerPoint, use MathType to add equations to QuarkXPress and Adobe InDesign layouts, Excel spreadsheets, HTML pages, and many more applications and document types.

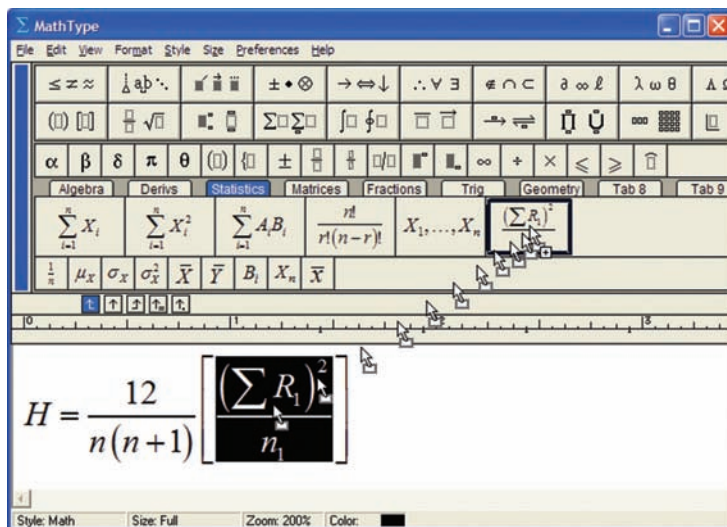

MathType Works with Wikipedia

Wikipedia, the popular online encyclopedia, contains 1000's of pages with mathematical equations. Once you do your research on Wikipedia, you can copy the relevant equations for use in your own work. You can also use MathType to author new equations for Wikipedia.

System Requirements

MathType 6 for Windows runs on Windows Vista, XP, and 2000. MathType 5 for the Macintosh runs on Mac OS 10.3.9 or newer. You need a CD-ROM drive for installation unless you download via the Internet.

What teachers are saying about MathType 6...

"I love this product (and use it every day)... I am ecstatic!!!!!"
— Donna Roberts, Mathematics Educator

"MathType is a treasure that lets me make and edit custom quizzes, tests, worksheets. This way I don't have to recreate them from year to year. It lets me do anything I ever wanted to do with math and Word."

— Jennifer Silverman, High School Math Teacher,
Miss Porter's School, Farmington, CT

"I have been using [MathType] for years, and can't imagine trying to live in a math or science classroom without it."

— John Mann, High School Science Teacher,
Lewis Palmer High School, Monument, CO

Free 30-Day trial

Download MathType and try it for 30 days – no obligation.
